Wiring diagram

Functional principle

Retro-reflective sensors incorporate emitter and receiver in the same compact housing. The light beam of the emitter is directed towards a reflector which returns the light back to the receiver. An object is detected when it interrupts this beam. Retro-reflective sensors incorporate some of the advantages of opposed mode sensors (good contrast and high excess gain). Further it is merely

A smaller sensing range and susceptibility of devices without polarisation filter can be of disadvantage when shiny objects have to be detected.
